## Three Models to Purify the Air & Sanitize the Surfaces in a Facility

Think about it...

The air you breath in a crowd space can be every bit the potential means of contracting an infection as are the surfaces you touch...especially in a healthcare setting, where so many of the occupants are there to be treated for a variety of communicable diseases.

Studies have shown that this is a serious cause of concern, and we have the cure.

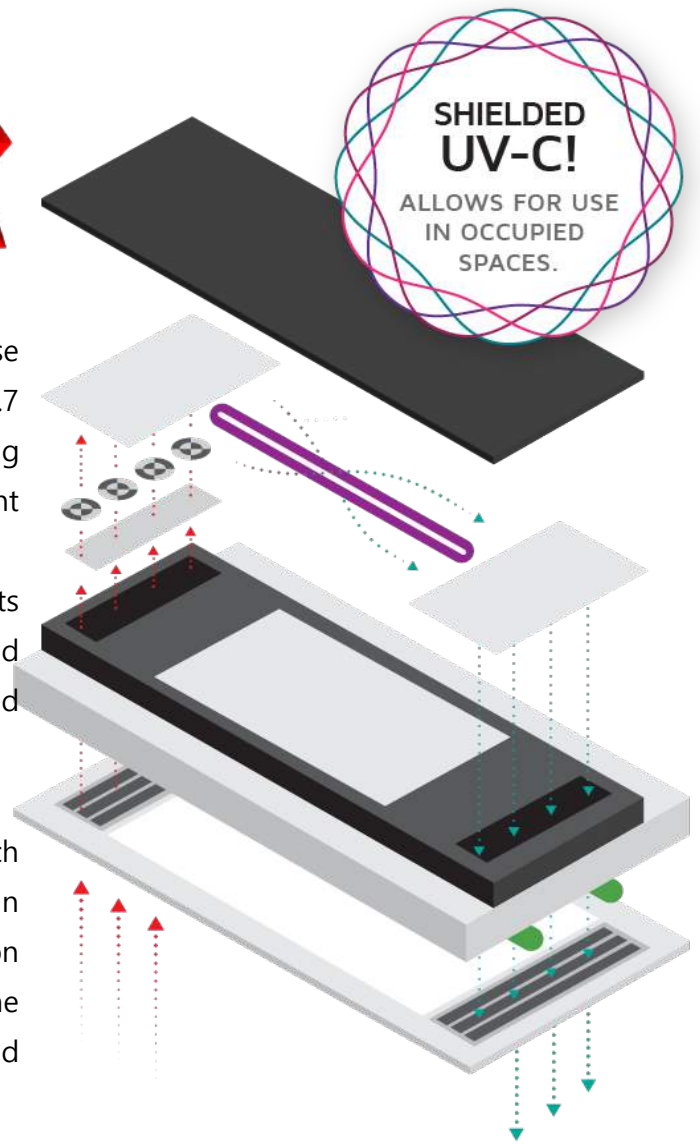

# GUARDIAN X {APRS}

UV Lighting has a multiple-decades long history of use in the healthcare industry. The UV wavelength of 253.7 nanometers has been well established as having excellent disinfection grade efficacy in the constant effort to neutralize harmful pathogens.

When used as a surface disinfectant, it has had its challenges: struggles with direct contact on multi-angled surfaces, and the fact that it can't be used in occupied spaces has made its full-potential application difficult...

Until now.

Air circulates all around the rooms the spaces in which we live, work, treat and care for patients. That air can carry these same harmful pathogens as are found on the surfaces we touch, and can deliver germs from one person or surface to another. This can be addressed with a Guardian-X UV-C unit.
